                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1754
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1814
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AATTTAACCTGTGACTAGTTATCTCTACCGAAGGTGGATGTGTAGTTTCTGGTTTTAAAA 1874

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1694
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1754
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1814
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1874
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether progression of prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         104
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        164
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       224
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                284

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether progression of prostate cancer; (b) monitoring the progression of prostate cancer; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                    345 TICAAGCAAACIGGAAATAATCCAICTAATTAIGCITTCCTTCCCAAGAAGTTTTTAA 404

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1790
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1850
                                                                                                                                                                                     The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                259
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 379
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; se:
                                prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (i) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                        Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker;
pharmacogenomic marker, gene; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .731 ACAGAGAATCGAAGGATTCTGTTCAAATATTAGTAAAAATTGAAAATAAACTTGTGCTTA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       176 ACAGAGAATGGAAGGATTCTGTTCAAATATTAGTAAAAATTGAAAATAAAACTTGTGCTTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAAATAAAAAAGATGAAATGAAGCATATATAATTGTCAATTTTTTCAATTTTTCTAGTCA 1730
                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indoblence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                              à
                                                                                                                        엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV02213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h)

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or incolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      257

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (g) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) assessing the prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (a) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether paratises afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) assessing the prostate cancer has metastasized in a patient; (h)

                                                                                                                                                  The invention relates to an isolated nucleic acid molecule (I), comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogent potential of a compound; (g) determining whether prostate cancer cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient (h)
                                                                                                                                                                                    273
assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (D) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate calc cancer in a patient; determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 381;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1.4%; Score 52; DB 5; Length 301.100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, increament of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker;

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) salecting a composation for inhibiting prostate cancer in a patient; (f) assessing the prostate cal carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (g) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaenia; nervous system disorders; archritis; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 424 BP; 100 A; 114 C; 73 G; 136 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                               the encoded proceins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polympetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopolisals regulating activity, issue growth factor activity, immunomodulatory activity and activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                              diagnosing
                                                                                                                                                                                                                                                                                                                 The invention relates to human polynucleotides (AAI79941-AAI93841) and

This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention such as tumourigenesis, angiogenesis, apoptosis, inflammation, earthropotasis, or the bological response to hypoxia conditions including processes such as glycolysis, gluconeogenesis, glucose transportation, catecholamine synthesis, gluconeogenesis, glucose transportation, catecholamine synthesis, into transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory conditions or wound healing. The present sequence is that of
            New substantially purified polypeptide, useful for diagnosing or treating a hypoxia-regulated condition, such as cancer, ischemia, reperfusion injury, retinopathy, pre-eclampsia, atherosclerosis, inflammation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a disease related protein encoding DNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; cervical cancer; cervical cancer marker; cancer therapy; detection; gene therapy; vaccine; gene; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human cervical cancer cell marker encoding cDNA SEQ ID NO:67.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1820 BP; 451 A; 485 C; 472 G; 412 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                          Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer.
                                                                                                                                                                                                                                                  AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human; disease state; cytostatic; antiinflammatory; ophthalmological; antiarteriosclerotic; vulnerary; gene therapy; hypoxia-regulated condition; tumourigenesis; angiogenesis; apoptosis; inflammation; erythopoiesis; glycolysis; gluconeogenesis; glucose transportation; catecholamine synthesis; iron transport; nitic condition; reperfusion injury; retinopathy; neonatal stress; pre-eclampsia; atherosclerosis; inflammatory condition; wound healing; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

given in ABR92047 to ABR92164. A higher level of expression of (1) than normal indicates the presence of cervical cancer. Also described: (1) assessing (11) containing (1); and assessing (11) containing (1); and (3) assessing (M1) whether a patient is afflicted with cervical cancer, comprising comparing the level of expression of a marker in a patient's sample, and the normal level of expression of the marker in a control non-cervical cancer sample, where a significant increase in the level of expression of the marker in the patient's sample relative to that in the cortrol sample is an indication that the patient is afflicted with cervical cancer. (1) has gycostatic activity, and can be used in gene therapy and in vaccines. (1) is useful in detecting, characterising, therapy and in treating human cervical cancers. (1) may also be used in warious prognostic and diagnostic assays, pharmacogenomics and in

New method for diagnosing hepatocellular carcinoma.

Claim 3; Page 43-44; 52pp; English

This sequence represents a gene, designated L4, whose expression is activated in human hepatoblastoma HepG2 cells in the presence of hepatitis B virus x antigen (HBXAg) compared to expression in HepG2 cells in the absence of HBXAG. The full-length cDNA was obtained from HepG2 cells using 5' and 3' RACE. No sequence homology was found between L4 and any previously known sequence. Synthetic peptides that represent probable antigenic determinants of the L4 protein are provided in AAY06538 and AAY06539. L4 is 1 of 10 genes (see AAX87402-11) that were initially identified by PCR select CDNA subtraction as showing differential expression in HBXAg(+) and HBXAg(-) cells. It can be used as a molecular marker for hepatocellular carcinoma (HCC). In a claimed method for marker for hepatocellular carcinoma (HCC). In a claimed method for letecting HCC, a liver tissue sample is obtained from a patient, and the level of expression of 1 or more marker genes, such as L4, in the sample is assessed. A reduction in the level of expression of the marker genes

```
ö
in the sample as compared to the expression level in noncancerous liver tissue is indicative of HCC. The method allows screening for the risk of disease and early diagnosis before tumours develop

ö The invention relates to an isolated nucleic acid molecule (I) comprising a nuclectide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is a fillicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastesized in a patient; (s) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker Gaps ö Length 265; 0; Indels Sequence 265 BP; 159 A; 27 C; 31 G; 48 T; 0 U; 0 Other; Query Match

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA00010-AA013910) that exhibit activity elating to prytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                            Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (e) selecting a compound to inhibit prostate cancer in a patient; (f) assessing the prostate calc in a patient; (f) assessing the prostate calc or inhibiting prostate cancer in a patient; (f) assessing the prostate cancer has metastasized in a patient; determining whether prostate cancer has metastasized in a patient; (g) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                     Human, prostate cancer, cytostatic; carcinogen, pharmacodyanamic marker, pharmacogenomic marker; gene; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a novel isolated breast specific nucleic acid molecule. The polypeptides of the invention have cytostatic activity. The movel nucleic acids and polypeptides may have a use in gene therapy, and as vaccines. The breast specific nucleic acid and polypeptide are useful for diagnosing and monitoring the presence and metastases of lung cancer. In a patient. The antibody that specifically binds to the breast specific polypeptide is useful for determining the presence of a breast specific polypeptide is useful for determining the presence of a breast specific portein in a sample, as well as for treating a patient with breast cancer. particularly by inducing an immune response against the breast cancer cell expressing the breast specific nucleic acid molecule or useful for identifying diagnosing, monitoring, staging, inaging and treating breast cancer and non-cancerous disease states in breast tissue. These are also useful in gene therapy, production of transgenic animals and cells, and in the production of engineered breast tissue for treatment and research. The sequences shown in AB277987-ABZ78101
                                                                                                                                                                                                                                                                                           New breast specific genes and proteins, useful in gene therapy or as vaccines for treating breast cancer or non-cancerous breast diseases, as well as for diagnosing, monitoring or staging these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (e) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

                                                                                                                                                           The present sequence represents a DNA fragment which is complementary to mRNA sequences whose level of expression in the brains of Alzheimer's disease patients varies from normal individuals. The present sequence represents a specifically claimed DNA fragment in which the expression is augmented to at least twice that in normal cases. The sequence, and antibodies to the proteins encoded by the sequence, may be used in the diagnosis, treatment and investigation of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fifty nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.

The polymucleotide sequences given in AAC79681 to AAC79730 encode the human secreted proteins given in ABB44595 to AAB44645. AAB44646 to AAB44693 represent human secreted polypeptide sequences and proteins howelogous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive; noorcropic; neuroprotective; antivital; or unitallergic; hepatotropic; antidiabetic; antifundation; antibuleary; anticonvulsant; antidiabetic; antifundation; antiparasitic; and cardiant. The polymucleotides and polypeptides are useful for preventing, treating or ameliorating a medical condition in e.g. humans, mice, rabbits; goats, horses, cas, dogs, chickens or sheep. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities; The polymucleotides are useful for chromosome identification. They are also useful as probes for diagnosing and ovarian cancer. They are also useful in the gene therapy of breast and ovarian cancer. The nucleic acids, protein, antibodies, agonists and antegonists from the present invention are useful in the diagnosis, treatment and prevention of: cancer; immune disorders; and in the ARC79672 to AAC79680 and AAB4455 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens have extosteratic activity and can be used in gene therapy cancer antigens have extosteratic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Additionally and Additionally sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027

Claim 1; Page 360; 410pp; English

The polynucleotide sequences given in AAC79681 to AAC79730 encode the human secreted proteins given in AAB44596 to AAB44645. AAB44646 to

Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer.

AAB44693 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: Cytostatic; immunosuppressive; noorropic; neuroprotective; antivital; antivities include: Cardiant. The genes are thindiabetic; antifuflamatory; antivital; vulnerary; anticonvulsant; antidabetic; antifuflamatory; antiparasitic; and cardiant. The polymucleotides and polypeptides are useful for preventing, trabite; goats, horses, cats, dogs, chickens or sheep. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. The polymucleotides are useful for chromosome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system, particularly breast and ovarian cancer. They are also useful in the gene therapy of breast and ovarian cancer. The mucleic acids, protein, antibodies, agonists and and ovarian the present invention are useful in the diagnosis, treatment and prevention of: cancer; immune disorders; cardiovascular AC79672 to AAC79680 and AAB44955 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB43399. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antiathmatic; antidabetic; antiathmatic; antidabetic; antiathmatic; antidabetic; antiphromic; antidabetic; antiphromic; antidabetic; antiphromic; antidabetic; cardial; thrombolytic; cagulant; dermatological; neuroprotective; cardiant; thrombolytic; cagulant; nootropic; vascropic; antiphromic; and antiangiogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Collymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune collers, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and abcrerial or viral infections. The present shorty screens. AAC78449 to AAC78457 and antagonists may be also be used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; breast carcinoma; cancer; tumour; cytostatic; anti-tumour; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide library useful in molecular characterization of a carcinoma, comprising a pool of polynucleotide sequences or its subsequences which are either underexpressed or overexpressed in tumor

The present invention describes a polynuclectide library (I) useful in the molecular characterisation of a carcinoma, comprising a pool of polynuclectides or its subsequences which are either underexpressed or overexpressed in tumour cells, and correspond to any of the polynuclectide sequences given in ABV94010 to ABV94447. Also described: (I) a polynuclectide array (II) useful for the prognosis or diagnostic of tumour, comprising (I); and (2) detecting (MI) differentially expressed polynuclectide sequences which are correlated with a cancer, involves obtaining a polynuclectide sample from a patient, and reacting the polynuclectide sample obtained with a probe immobilised on a solid support, where the probe comprises any combination of the polynuclectide sequences of (I) or its expression product of the polynuclectide sequences of (I), and detecting the reaction product (I) have cycostatic activities and can be used as anti-tumour agents. (I) are useful in molecular characterisation of a carcinoma. (I) and (II) are useful for the prognosis or diagnostic of tumour, in differentiating a normal cell, differentiating a tumour with lymph nodes from a tumour without commal cell from a cancer cell, detecting a hormone sensitive tumour cell, mand a netracycline-sensetive tumours. (I) is useful for large-scale molecular characterisation of breast cancer that help in prediction, prognosis and cancer treatment, and for detecting differentially expressed genes that cancer certacted with a cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                        The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer. (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indelence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient
                                                                                   Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, cytostatic; diagnosis; prostate disorder; prostate cancer; BPH; benign prostatic hyperplasia; SAP-1 protein; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer. (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (e) selecting a compound to inhibit prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker;
pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

The present invention relates to methods of detecting a prostate cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancerassociated polymucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancerassociated polymucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer associated genes are useful for diagnosing or treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that thibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

ABK92115-ABK92263 represent prostate cancer-associated polynucleotide
                                                                                                                                                                                                                   Detecting a prostate cancer-associated transcript in a cell in a patient, useful for diagnosing prostate cancer (PC) or screening modulators of PC, by determining if prostate cancer-associated genes are expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytostatic; gene therapy; inflammatory disorder; neural disorder; Parkinson's disease; Alzheimer's disease; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; muscular disorder; ischaemia; reproductive disorder; Crohn's disease; pulmonary disorder; sancer; myocardial infarction; glomerulonephritis; nephrotic syndrome; tumour; haematopoietic disorder; rhinitis; asthma; diabetes; atherosclerosis; anti-sense therapy; endocrine disorder; leukaemia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses a method for diagnosing, prognosing or monitoring a prostate disorder which involves the analysis of 26 gene transcripte (referred as markers) that exhibit bebrant expression levels in prostate disorder tissues and provides a means of early diagnosis. This method is useful for diagnosing, prognosing or monitoring a prostate disorder. It also provides a means of distinguishing prostate cancer from benign prostatic hyperplasia (BPH) and for identifying potential anti-prostate disorder. It disorder therapeutic compounds. The present sequence is a human DNA encoding SAP-1 protein (referred as marker 20). The SAP-1 protein is identified as a protein recruited by serum response factor to the c-fos
                                                                                                                                                                                                                                                                                                                                   Diagnosing and monitoring prostate disorders, by analysis of 26 gene transcripts that exhibit aberrant expression levels in prostate disorder tissues, and provides a means of early diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

cencoding a human secreted protein, representing one of 15 novel genes.

Also included are recombinant vectors, host cells (expressing the protein), the secreted proteins (including their fragments, epitopes and homologues), an isolated antibody that binds specifically to the protein, diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological a condition based on the presence or absence of the mutation), diagnosing a pathological condition or susceptibility to a pathological condition of susceptibility to a pathological condition of comprising determining the presence or amount of expression of the protein in a biological sample and diagnosing a condition of the protein in a biological sample and diagnosing a condition or ameliorating medical condition by administering the nucleic acid or protein to a mammalian subject, identifying a binding partner to the protein to a mammalian subject, identifying a binding partner to the protein to a mammalian subject, identifying a binding partner to the protein to a mammalian subject, comprising expressing the nucleic acid in a cell, isolating the supernatant having the activity) in a biological assay of the protein in the supernatant having the activity). The nucleic acids the protein display the following activities Cytostatic, antibacterial, virucide, Neuroprotective, Gynaecological, Gastroincestinal-Gen, Cardiant, Cardiovascular-Gen, Nephrotropic, Antiinflammatory, Muscular-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; 88; gene; p53 modifier; cytostatic; cancer; cytostatic; antiangiogenic; antiapoptotic; p53 pathway; breast cancer; colon cancer; kidney cancer; lung cancer; ovarian cancer; angiogenesis; cell cycle; apoptotic disorder; cell proliferation disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying modulators of the p53 pathway for use in treating apoptotic or cell proliferation disorders, comprises screening for agents that modulate activity of a human ortholog of genes that modify the p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Funke RP;

modulating agent, by contacting an assay system comprising a purified HM polypeptide (human orthologue of genes that modify the p53 pathway in Drosophila) or muclaic acid with a test agent under conditions, where but for the presence of the test agent bushed activity of the assay system. Corresponding a rest agent-biased activity of the assay system. Also included are modulating (MA) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator contacting a cell defective in p53 function with a candidate modulator in a mammalian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide comprising an HM amino acid sequence, where p53 function is restored), modulating (M3) a p53 pathway of a disease in a patient (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosting (Specifically binds an HM polypeptide or nucleic acid) and diagnosting (Comparising contacting the sample with a probe for HM expression; (c) comparing the results with a control; and (d) determining whether the comparing the results with a probe for HM expression contacting the patient; (b) contacting the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where disease, of the p53 pathway, such as, angiogenesis, apoptotic or cell to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell confideration of the cell, so that the cell undergoes normal confidence or also useful for modulating the p53 pathway such as angiogenic, also useful for treating defects in the p53 pathway such as angiogenic, also useful for treating defects. The present sequence is an HM collect acid encoding a p53 pathway modifying protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 2038 BP; 527 A; 580 C; 567 G; 364 T; 0 U; 0 Other;

Measuring changes in expression of 264 cancer associated genes for detection of stomach cancer and screening of potential anticancer agents.

```
ö
                            The invention relates to a method for the detection of cancer in which a change in the expression of 1 or more of 264 specified cancer associated egenes, ABZ71694-ABZ71657, or of sequences at least 80% homologous to them in the specimen tissue as compared to normal tissue is observed. The genes are used in detection, diagnosis and treatment of cancer, especially of stomach cancer. The present sequence is that of a cancer associated polymucleotide of the invention. Note: The present sequence was not given in the printed specification but was isolated using the Genbank accession number given in the DE line
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynuclectides 95% identical to the sequences of the invention. The invention additionally relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ovarian antigen; ovary; ovarian; breast; cancer; tumour; ovarian cancer; breast cancer; tumour; reproductive system disorder; infertibility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; ene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antinflammatory; gynaecological; reproductive; chromosome 3p14.3; gene;

polynucleotides, antibodies against human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of of orwarian antigen polynucleotides and polypeptides; in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system (alsorders (e.g., infertiolty, disorders of pregnancy, ancoulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea, endocrine disorders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders antimucodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), lood-related disorders (e.g., anaemia), cardiovascular disorders and uninary system disorders. Ovarian antigen polypeptides and modulate ovarian antigen expression or activity. The polymucleotides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present of sequence represents conditions or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present compensation of individuals and in foremic analysis, and the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the printed specification, but was obtained per electronic format directly from the printed specification, but was obtained per electronic format directly from the printed specification, but seed sequences. AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; valnerary; antipporiatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiporial; thrombolytic; antiparkinsonian; nootropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antihiflammatory; antibacterial; antiviral; antifthugal; antithreumatic; antithyroid; antibacterial; antithreumatic; antithyroid; antibacterial; to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegemerative clastores, proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegemerative disorders, osteoarthritis, graft we host disease, cardiovascular disease, disorders, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplandal infection, malaria, autoimmune cartilage damage, noctural hemoglobinutia, antinflammatory disease; to Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease. enhance coagulation; to inhibit thrombosis; and as a contraceptive 1.3%; Score 49; DB 3; Length 2543; 100.0%; Pred. The invention relates to nucleic acid molecule, designated CD2000 which encodes a polypeptide containing immunoglobulin (1g) and 1g-like domains and SAM associated protein (SAP) motifie. CD000 DNA and protein is useful for treating disorder such as immune proliferative disorders, immune disorders (e.g. carcinoma), viral infection, autoimmune disorders (e.g., arthritis, multiple sclerosis, Graves disease, and Hashimoto's disease), T cell disorder (e.g. acquired immune deficiency syndrome (AIDS)), inflammatory bowel disease (e.g. treumatoid arthritis and colitis), inflammatory disorders (e.g. treumatoid arthritis and colitis), inflammatory disorders (e.g. systemic lupus erythematosus, and psoriasis), apoptotic disorders (e.g. systemic lupus erythematosus, and insulin-dependent diabetes mellitus), cytocoxic disorders, septic shock, cinsulin-dependent diabetes mellitus), cytocoxic disorders, septic shock, corronic obstructive pulmonary disease (e.g. emphysema), bronchtis, cachexia, jaundice, hepatic circulatory disorders, hepatitis, cirrhosis, acute myeloid leukaemia, haemophilia and anaemia. CD2000 DNA is used in gene therapy. CD2000 DNA is useful in screening assays, monitoring clinical trials and pharmacogenomics), and in methods of treatment (e.g. chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical therapeutic and prophylactic). The present sequence is human CD2000 DNA. Human CD2000 gene is located at chromosome 1q23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 2713 BP; 799 A; 647 C; 529 G; 738 T; 0 U; 0 Other;

The invention relates to nucleic acid molecule, designated CD2000 which encodes a polypeptide containing immunoglobulin (Ig) and Ig-like domains useful fark associated protein (SAP) motifis. CD3000 DNA and protein is useful for treating disorder such as immune proliferative disorders in method of a carcinoma), viral infection, autoimmune disorders (e.g., arthritis, multiple selerosis, Grave's disease, and Hashinoto's disease), T cell disorder (e.g. arcuiroders (e.g. crucinoma), viral infection, autoimmune disorders (e.g., arthritis, and disease), Inflammatory bowel disease (e.g. crohn's disease and ulcerative (AIDS)), inflammatory disorders (e.g. crohn's disease and ulcerative colitis), inflammatory disorders (e.g. rheumatoid arthritis and osteoarthritis), allergic inflammatory disorders (e.g. asthma and psoriasis), apoptotic disorders (e.g. systemic lupus erythematosus, and psoriasis), allergic inflammatory disorders (e.g. emphysemal, bronchitis, chromic obstructive publimonary disease (e.g. emphysemal, bronchitis, carchexia, jaundice, hepatic circulatory disorders, hepatitis, cirrhosis, acute myeloid leukaemia, haemophilia and anneamia. CD2000 DNA is useful in screening assays, detection assays, ed.g. chromosomal mapping, tissue typing, forensic biology), predictive (e.g. chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials and pharmacogenomics), and in methods of treatment (e.g. human CD2000 DNA therapeutic and prophylactic). The present sequence is human CD2000 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated polypeptide containing immunoglobulin and immunoglobulin-
like domains and SLAM associated protein, termed CD2000 or CD2001, useful
for treating immune, inflammatory, or hepatic circulatory disorders.
                                                                                                                                                                                                                         Human; immunoglobulin; Ig; SLAM associated protein; SAP; CD2000 protein; immune proliferative disorder; immune disorder; rheumatoid arthritis; carcinoma, autoimmune disorder; multiple sclerosis; grave's disease; Hashimoto's disease; acquired immune deficiency syndrome; hepatotropic; osteoarthritis; allergic inflammatory disorder; viral infection; asthma; psortasis; apoptotic disorder; systemic lupus erythematosus; bronchitis; diabetes mellitus; septic shock; chronic obstructive pulmonary disease; emphysema; cachexia; hepatic circulatory disorder; hepatitis; cirrhosis; acute mysloid leukaemia; haemophilia; anaemia; gene therapy; cytostatic; immunosuppressive; neuroprotective; antiniflammatory; Crohn's disease; osteopathic; antibacterial; immunosudulator; inflammatory bowel disease; jaundice; dermatological; ulcerative colitis; AlDS; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 78; 138pp; English.

Human CD2000 DNA #1 Homo gapiens EP1223218-A1 17-JUL-2002. Fraser CC; AAD43564; RESULT 62 AAD43564 ID AAD43 XX 셤

The invention relates to nucleic acid molecule, designated CD2000 which encodes a polypeptide containing immunoglobulin [1g] and 1g-like domains useful for treating disorder such as immune proliferative disorders.

In mune disorders (e.g. carcinoma), viral infection, autoimmune disorders (e.g., arthritis, multiple sclerosis, Grave's disease, and Hashimoto's disease), T cell disorder (e.g. arduired immune deficiency syndrome (e.g., arthritis, multiple sclerosis, erguired immune deficiency syndrome (albs)), inflammatory disorders (e.g. rheumatory syndrome (albs)), inflammatory disorders (e.g. rheumator) asthma and osteoarthritis), allergic inflammatory disorders (e.g. asthma and osteoarthritis), allergic inflammatory disorders (e.g. asthma and osteoarthritis), allergic inflammatory disorders (e.g. asthma and osteoarthritis), allergic inflammatory disorders, septic shock, chronic obstructive pulmonary disease (e.g. emphysema), bronchtis, cachexia, jaundice, hepatic circulatory disorders, hepatitis, cirrhosis, cuther myeloid leukaemia, haemophilia and anaemia. CD2000 DNA is useful in screening assays, detection assays (e.g. chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials and pharmacogenomice), and in methods of treatment (e.g. human CD2000 DNA therapeutic and prophylactic). The present sequence is human CD2000 DNA

```
Novel isolated polypeptide containing immunoglobulin and immunoglobulin-
like domains and SLAM associated protein, termed CD2000 or CD2001, useful
for treating immune, inflammatory, or hepatic circulatory disorders.
                                                                                                                                                                                                                               immune proliferative disorder; immune disorder; rheumatoid arthritis; carcinoma; autoimmune disorder; multiple sclerosis; Grave's disease; Hashimoto's disease; acquired immune deficiency syndrome; hepatotropic; osteoarthritis; allergic inflammatory disorder; viral infection; asthma; psoriasis; apoptotic disorder; systemic lupus erythematosus; bronchitis; diabetes mellitus; septic shock; chronic obstructive pulmonary disease; emphysema; cachexia; hepatic circulatory disorder; hepatitis; cirrhosis; acute myeloid leukaemia; hamophilia; anaemia; gene therapy; cytostatic; immunosuppressive; neuroprotective; antilinflammatory; crohu's disease; osteopathic; antibacterial; immunosupatory; crohu's disease; jaundice; dermatological; ulcerative colitis; AIDS; gene; ds.

The CD23 polypeptides can be expressed by standard recombinant methodology. The CD23 polymucleotides are useful for protecting canide from diseases mediated by CD23, for developing compounds that regulate Igg and/or CD23 levels in a canid for treating allergy related diseases such as atopic dermatitis, asthma, hay fever and food sensitivities. The present sequence represents a CD23 nucleic acid molecule nCaCD23_2851

```
The invention relates to novel purified or isolated nucleic acids of
essential genes of Aspergillus fundatus. The isolated nucleic acids of
the invention are used to treat or prevent infections by a pathogenic
organism such as A. fundatus, to treat a non-infectious disease in a
subject (e.g. cancer), to prevent or tontain contamination of an object
by A. fundatus, or to prevent or inhibit formation on a surface of a
by A. fundatus, or to prevent or inhibit formation on a surface of a
corporation recombinant protein for characterisation, screening or
therapeutic use, as markers for host tissues in which the pathogenic
corganisms invade or reside, for comparing with the DNA sequences of other related or distant pathogues having the same or
similar biochemical activity and/or function, for comparing with DNA
sequences of other related or distant pathogues, for selecting and
making oligomers for attachment to a nucleic acid array for examination
of expression patterns, for raising anti-protein antibodies, as an
antigen to raise anti-DNA antibodies or to elicit another immune
response, and for identifying polynucleotides encoding the other protein
with which binding occurs or to identify inhibitors of the binding
occurs or to identify inhibitors of the protein
with which binding occurs or to identify inhibitors of the protein
theraction. The polypeptides may be used to raise antibodies or to
determine lesponse, as a reagent in assays designed to quantitatively
that is now to in the pathogue in invise and and in and the content of the protein in biological fluids as a marker for
the pathogue and the protein in biological fluids as a marker for
the pathogue and the protein in biological fluids as a marker for
the pathogue and the protein in biological fluids as a marker for
the pathogue and the protein in biological fluids as a marker for
the pathogue and the pathogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page; 175pp; English.

                                                                                                                                                                                                                                                                                                                                                                                           Jiang B,
   The invention relates to isolated canine low affinity immunoglobulin E (IGE) receptor (CD23) polypeptides and encoding nucleic acid molecules. The CD23 polypeptides can be expressed by standard recombinant methodology. The CD23 polymucleotides are useful for protecting canids from diseases mediated by CD23, for developing compounds that regulate IGE and/or CD23 levels in a canid for treating allergy related diseases such as atopic dermatitis, asthma, hay fever and food sensitivities. The present sequence represents the complementary sequence of the CD23 nucleic acid molecule nCaCD23_2851
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated canine low affinity immunoglobulin E receptor nucleic acid molecule, useful for protecting canids from diseases mediated by the receptor, such as allergy, atopic dermatitis, asthma, and hay fever.
                                                                                                                                                                                                                                                                                                                    Canine; immunoglobulin B; IgB; CD23; antiallergic; antiasthmatic; antiinflammatory; dermatological; gene therapy; vaccine; ds.

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus funigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. funigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. funigatus, or to prevent or inhibit formation on a surface of a carpressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA captures of other related or distant pathogenic organisms to identify contains and or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of contains and c of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polyuclectides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for isolate correlative receptors or ligands in the case or virulence factors. This polymucleotide sequence represents one of the essential genes of Aspergillus fumigatus of the invention Sequence 3362 BP; 774 A; 901 C; 867 G; 820 T; 0 U; 0 Other;

Novel secreted or transmembrane protein and polynucleotide encoding the protein, useful for diagnosis and treatment of neurological disorders, cancer, autoimmune diseases, bone disorders and lung or liver fibrosis.

Claim 34; Page 106-108; 284pp; English

The invention relates to human secreted or transmembrane protein (1), their fragments and is encoded by specific complementary deoxyribonucleic acid (CDNA) inserts (II), where the protein is aubstantially free from other mammalian proteins. (I) are useful for preventing, treating or analozating or the mammalian proteins. (I) act useful for preventing, treating or prevention of tumours. (I) exhibits activity relating to angiogenesis, cytokine, cell proliferation, cell differentiation, antimiflammatory, stem cell growth factor activity and activin or inhibin-related activities. (I) can be used to manipulate stem calls in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease, accidental damage or rise to neuroepithelial cells that can be used to augment or replace contral and peripheral nervous system diseases and neuropathies, such as Alzaeimer's, Parkinson's disease, Huntington's disease, anyotrophec central and peripheral nervous system diseases and neuropathies, such as Alzaeimer's, Parkinson's disease, Huntington's disease, anyotrophec activity, regulation of haemacopolesis and is useful for treating weloid or lymphoid cell disorders, platelet disorders such as thrombocytopaenia and for regeneration of hone, cartilage, tendon, ligament and/or nerve tissue growth and in tissue repair, healing of burns, incisions, uncertaing osteoporosis, osteoarthritis, bone degeneration of severe combined insunodeficiency (SCID), bacterial or fungal infections, a various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, dabetes mellitus, myasthenia gravis, allergic reactions and conditions, crecombinant protein, as markers for tissues in which the corresponding crecombinant protein, as markers for tissues in which the corresponding sequence is that of a polymucleotide of the invention

The invention relates to novel purified or isolated mucleic acids of essential genes of Aspergillus funigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. funigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. funigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. funigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic corganism invade or reside, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA corporates of or of distant pathogenic organisms to identify operatial orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for rasising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune cours or to identify inhibitors of the binding circurs or to identify inhibitors of the binding circurs or to interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fungicide; cytostatic; essential gene; Aspergillus fumigatus; infection; cancer; contamination; biofilm; antibody; immune response; ds.

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. funigatus, to prevent or inhibit formation on a surface of a corporation comprising A. fumigatus. The polymucleotides are useful for expressing recombinant protein for characterisation, screening or thraspeutic use, as markers for host tissues in which the pathogenic organisms invide or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify making oligomers for attachment to a nucleic acid array for examination making oligomers for attachment to a nucleic acid array for examination
                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polynucleotides encoding the other protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fungicide, cytostatic, essential gene; Aspergillus fumigatus; infection; cancer; contamination; biofilm; antibody; immune response; ds.
host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This polymuclectide sequence represents one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                    Gaps

New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for isolate correlative receptors or Idjands invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This polymucleotide sequence represents one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

The invention relates to a purified nucleic acid molecule associated with cartation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second mucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX14836-ABX49947, or complements of them. Also included are complemented to a promoter and a 3 non-translated sequence that acid linked to a promoter and a 3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of transcription and addition of polyadenylated ribonucleotides to a 3' end of transcription and addition of polyadenylated ribonucleotides to a 3' end of transcription and addition of the complementary nucleic acid sequences or its complementary nucleic acid molecule obtained from the bovine cell or tissue complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is predictive of the complement and analyses, carried to genetically improving cattle. The present sequence was not shown in the specif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                              Bovine; ss; EST; expressed sequence tag; lactation; LMFD;

```
The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypetide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for informance, in assessing biodiversities, or in identifying matations in foremaics, in assessing biodiversities, or in identifying matations responsible for genetic disorders and other traits. The nucleotide for corresponding to the recombinant production of for chromosome and gene mapping, in the recombinant production of protein, or in generating antishodies specific for it. The present sequence is useful for generating antishodies specific for it. The present sequence for this patent did not form part of the printed specification, but was obtained in electronic format directly from USTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid molecule (1) comprising a nuclectide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (1) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (1) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                       Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker;
pharmacogenomic marker, gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodilatory activity and activity, insue growth factor activity, immunomodilatory activity and activity, insue growth factor activity, immunomodilatory activity and activity, influencediates and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, cytokine, cell proliferation; cell differentiation, gene therapy, vaccine; peptide therapy, stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia;

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or retarment of cancer, laukaemia, nervous system diagnosis, arthritis and inflammation. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                           Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Jervical cancer; cytostatic; pre-malignant condition; gene therapy; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                   New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
                                                                                                                                                  The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-mallgnant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, secreted protein, diagnosis, cytostatic, immunosuppressive,

the polymucleotide sequences given in AAA26346 to AAA26458 encode the human secreted proteins given in AAY91451 to AAY91691. The human secreted proteins given in AAY91451 to AAY91691. The human secreted proteins can have activities based on the tissues and cells they are expressed in Examples of the activities are: cytostatic; antidiabetic; antiathaltergic, osteopathic; antiatharthriti; antibacterial; antidiabetic; antiatharthritic; antibacterial; antidiabetic; antiatharm; antipsoriatic; antiatharthritic; antibacterial; antidiabetic; cancellorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions are useful for preventing, treating or proteins in a sample or by determining the presence of mutations in the proteins in a sample or by determining the presence of mutations in the polymucleotides. Specific uses are described for each of the polymucleotides. Based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumouris, neurodegenerative disorders, developmental abnormalities and foctal described, and focated disorders, solizophrenia, osteoporosis, atthritis, infections, AlDS, spinal cord injuries, transplant rejection, diabetes, asthma, sepsis, acne, psoriasis, cardiovascular disorders, replicatory disorders, repriretying their binding patthers, The proteins are also useful for an focativitying their binding patthers, The proteins are also useful for an account in the avamplification of the preservatives. The proteins are also useful for an analysis of the interview.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to an Arabidopsis thaliana nucleic acid (I)

comprising a sequence capable of hybridising under stringent conditions

comprising a sequence capable of hybridising under stringent conditions

compared to a sequence selected from any one (1 99 sequences (ARNB99231),

given in the specification or its fragment. A polypeptide (II) encoded by

cycle of the specification or its fragment. A polypeptide (II) encoded by

II, a transgenic plant (III) comprising an exogenous nucleic acid, is

cycle of screening a candidate agent for its biological effect. (I) is

useful in identifying homologous or related genes, in producing

compositions that modulate the expression or function of its encoded

cycle of the manipulation of cells, particularly plant cells. (I) is also useful in

cycle ordered physiological pathways. (I) is also useful for the genetic

manipulation of cells, particularly plant cells. (I) is also useful in

cycle ordered physiological pathways. (I) is also useful in studying

cycle of the streamed agents are useful for screening of biologically active

cycle or programs to identify agents that mimic or enhance the action of tolerance

factors. Such agents are useful in improved methods of treating

cycle active active active active active action of tolerance

factors. Such agents that mimic or enhance the action of tolerance

factors. Such agents that mimic or enhance the action of tolerance

factors. Such agents that mimic or enhance the action of tolerance

factors. Such agents that mimic or enhance the action of tolerance

factors in thibiting production of a biosynthetic product in a plant.

CYCLIII is useful for identifying other mediators that may induce

cycle approximate to environmental stress. (I) is also useful action

cycle approximate to environmental stress. (I) active that may affect the biological in the study of genetic function and regulation.

CYCL all any affect the biological in a leavent one or gene products

construction of the callular metabolism and for screeni
                                                    Haas WD;
                                                                                                                                                                                                                                                                                                                                           New Arabidopsis thaliana nucleic acid for identifying homologous ge
producing compositions that modulate the expression or function of
encoded protein, and mapping functional regions of protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019341) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cycokines in other cell populations. The polynucleotides and polynpeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to the isolation of genes AAC78997-C79045 encoding 49 human secreted proteins AAB44315-B44382. The genes can be used to generate faithin proteins by linking to the gene for the human compared to the gene for the human protein of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliocating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the conditions, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone constrow, breast, gastrointestinal tract, liver, lung, or urogenital, (b) marrow, breast, autoimmune thyroiditis, diabetes mellitus, crohn's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple scleromis, theumatoid arthritis and ulcerative collisis, (c) cardiovascular disorders such as myocardial ischaemias, (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic
                                                                                                          Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fourty nine nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the coding sequence for a human secreted protein. The sequence was isolated from an adult lung cDNA llbrary. The proteins and coding sequences of the invention can be used in the proteins similar genes and proteins, in the elucidation of their function in vivo, and to treat a number of conditions. It is possible that they may have tases as nutritional supplements, as cytokine or cell proliferation factors, in immune modulation, where they may be used to treat immune autoimmune diseases, as haematopoiesis regulators (treating myeloid or lawbee chemokine or chemotactic activity, haemostatic or thrombolytic activity, or anti-inflammatory activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New secreted proteins and polynucleotides encoding them, which are derived from Homosapiens, useful for therapy, diagnosis, and research, as well as nutritional sources or supplements.

The invention describes polypeptides and their salts containing the sequence of human N-Tes polypeptides or derived from it, and inhibiting the activity of membrane-type matrix metalloprocteinses. The polypeptides are used for the treatment, prevention and diagnosis of cancer and cancer infiltration, angiogenesis, Alzheimer's disease and arthritis, and especially of glioma. This sequence encodes the novel N-Tes polypeptide described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human N-Tes polypeptide and its partial sequences inhibiting matrix metalloproteinase for treatment and diagnosis of glioma and other neurological and neoplastic disorders.

The present sequence encodes a filament-like protein 4 (FLIP4), which is used in the course of the invention. The specification describes a method whereby gene expression in a stably transformed transgent plant cell is regulated using a chimeric gene that encodes NMP1 (muclear matrix protein comprising a promoter linked to a DNA binding domain, a coding sequence or its complement, and a polyademylation sequence. The second gene comprises a promoter, a DNA binding domain, MMP1 or FLIP to polynucleotides, and a polyademylation sequence. Expression of the first gene regulates expression of the second. NMP1, FLIP and related proteins are parts of the methods are used to regulate gene expression in plants, comprises novel traits in transgenic plants that may result in new products useful in foods, pharmaceuticals and materials, or for products useful in foods, pharmaceuticals and materials, or for products useful in foods, pharmaceuticals and materials, or for suppression or l(MP1) or MP1-binding protein composition, and to derive new phenotypes beneficial for crop growth and development. NMP1, FLIP and related proteins are used to alter level of expression of MPP1 cubinding factor 1 (MPP1) or MPP1-binding proteins in plants that inhibit activity of MPP1- or MAP1-binding proteins in plants that inhibit activity of MPP1- or MAP1-binding proteins, which are potentially useful
                                                                                                                                                                                                                                                                                                                                                                   Regulating gene expression in plant cells, useful e.g. for expressing new traits, by introducing genes for transcriptional activators that interact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gape

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polypeptides. The sequences of the 122 PRO polypucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in perioyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the proliferation of normal human blood, for stimulating the proliferation of normal human blood, for stimulating the proliferation of normal human blood, weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABK33536-ABK33657 represent human PRO protein coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polymucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of from recombinant cell culture or natural sources. ACA6681-ACA6696 from represent DNA sequence encoding the human PRO pulypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide comprises are sequences having e.g. 4834, 2504 or 1759 bp fully defined in the comprises or polymelectides are useful concluded and the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polymelectides are useful cas pharmaceuticals, diagnostics, blosensors or bioreactors. These are comparing the prosecting tumours (e.g. lung tumour, oclon tumour, breast tumour, prostate tumour, rectal tumour, or liver tumour) concluding the proliferation or differentiation of chondrocyte concluding the proliferation of pericyte cells, or for modulating proliferation of pericyte cells, or for modulating normal human dermal fibroblast proliferation. The PRO nucleic acid or cortilage disorders (e.g. sports injuries or arthitis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases. The PRO polypeptides are useful markers, or for chromosome content as molecular weight markers, or for chromosome content in the sequence of these diseases. The PRO polypeptides are useful markers, or for chromosome content in gene therapy, particularly for replacing a defective content of the presence of themse secreted and transmenbrane PRO polyperides are useful man content and proven content of the presence of the presence of the presence of the presence of these diseases. The PRO genes may gener in gener therapy, particularly for replacing a defective contents and proven the proposes, or for contents and the presence of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New genes, and its encoded secreted and transmembrane polypeptides, useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis or wounds in a mammal.
                                                                                                                                                                                                                                             antiarthritic; osteopathic; gene therapy; TNF-Agonist-Alpha; chondrocyte stimulator; pericyte stimulator; fibroblast modulator; pharmaceutical; diagnostic; biosensor; bioreactor; tumour; lung tumour; oclon tumour; breast tumour; prostate tumour; rectal tumour; arthritus, bone disorder; cartilage disorder; sports injury; arthritis; wound; gene; ss.

                                                          The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endochelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated manular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, ungina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This sequence encodes a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

New PRO protein encoding nucleic acid, useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence

Claim 2; Fig 39; 324pp; English.

, Godowski PJ; Watanabe CK, Wood WI;

tumor in a mammal.

```
The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO cDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New mucleic acid encoding for a PRO protein, useful for the manufacture of a medicament for diagnosing or treating tumors or for measuring or detecting expression of an associated gene.
                                                                                                                                                                                                                         TNF-alpha; blood; chondrocyte;

```

```
The invention relates to a novel isolated PRO protein encoding nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating pobliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNR)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO cDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, ss; chondrocyte stimulation; TNF-alpha stimulation; gene thuman dermal fibroblast stimulation; tumour; tissue typing; gene;

The invention relates to an isolated nucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate itemiliation, TNP-alpha stimulation, human dermal fibroblasts stimulation and for detecting the presence of tumour in an mammal. The PRO polypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents cDNA encoding a human secreted/transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; PRO; membrane bound protein; membrane bound receptor; cell proliferation; cell migration; cell differentiation; mitogenic factor; aurvival factor; cytotoxic factor; differentiation factor; neuropeptide; hormone; cell receptor; receptor-ligand interaction; cytostatic; chondrocyte; tumour; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human membrane bound receptor/protein PRO10111 cDNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seguence 1837 BP; 527 A; 454 C; 465 G; 391 T; 0 U; 0 Other;

This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate convironment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may be useful for the manmal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the cDNA sequence encoding a human PRO protein of the invention
                                                                                                                                                                                                                                                    PJ;

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (I) PRO982, PRO1160, PRO1137 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO237, PRO222, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO231, PRO235, PRO1306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (INF)-cr are useful for stimulating the release of tumour necrosis factor (INF)-cr pRO247, PRO337, PRO353, PRO1036, PRO1419, PRO1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                               Human, secreted and transmembrane protein, PRO; gene, 88; cytostatic, vulnerary, antiarthritic; pericyte cell proliferation; pericyte cell proliferation; chondrocyte cell proliferation; chondrocyte cell proliferation; chondrocyte cell differentiation; ummour necrosis factor alpha release; (TNF)-alpha release, dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour; colon tumour, breast tumour; prostate tumour; rectal tumour; lissue typing; chromosome mapping; gene mapping;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gerritsen ME, Goddard A, Godowski PJ;
Smith V, Stephan JF, Watanabe CK, Wood WI;
Novel human secreted and transmembrane protein PRO10111 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 2; Fig 39; 305pp; English.

in a test sample of cells taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypepides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour prostate tumour, rectal tumour or typing, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO329, PRO1272 or PRO4405 polypepide is useful for treating bone and/or cartilage disorders (e.g., arthritis, proper injuries). This sequence encodes a human secreted and transmembrane
                                                                                                                                                                                                                                                                                                                                                                    PRO polypeptide.

New isolated PRO polypeptides useful as molecular weight markers in protein electrophoresis, useful for tissue typing, and for treating arthritis and tumors.

The invention describes an isolated PRO (secreted and transmembrane) polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are Claim 2; Fig 39; 308pp; English.

useful for stimulating the proliferation of or gene expression in bericyte cells. PR0259, PR02192 or ER04405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PR0211, PR0357, PR0229, PR02155, PR03106 or PR04419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF).

The strong the proliferation or differentiation of chondrocyte care useful for stimulating the release of tumour necrosis factor (TNF).

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polyunclectides encoding them.

Transmembrane polypeptides and the PRO polyunclectides encoding them.

The PRO polypeptides and polymuclectides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for prostate tumour, rectal tumour or liver tumour) in amammal, for prostate tumour cells, for the proliferation or differentiation of continulating the proliferation of or gene chood, for stimulating the proliferation of or gene commal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating continued and gene mapping, in generating technology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therappetically useful reagents, in generating probes. The PRO polypeptides, or anti-PRO may be used in the development and screening of therappetically useful reagents, in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for creating and condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polymorpide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New PRO polypeptides and nucleic acids encoding the polypeptides, usefule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gerritsen ME, Goddard A, Godowski PJ;

release;

tumour;

(first entry)

```
The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

useful for stimulating the pro11feration of or gene expression in

pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

for stimulating the pro11feration or differentiation of chondrocyte

cells. PRO211, PRO125, PRO125, PRO1186, pPRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMF)-

alpha from human blood. PRO982, PRO1055, PRO1306, PRO1419, PRO1419,

PRO1478, PRO1314, PRO926, PRO1065, PRO1083, PRO10141, PRO1310,

PRO1286, PRO1181, PRO1186, PRO1186, PRO1187, PRO10137, PRO1274, PRO1310,

PRO1286, PRO1387, PRO1387, PRO1387, PRO1373, PRO1274, PRO13140,

PRO1286, PRO1387, PRO1387, PRO1380, PRO1414, PRO1317, PRO13140, PRO13186,

PRO1286, PRO1387, PRO1387, PRO1380, PRO1444, PRO13140, PRO1318,

PRO1286, PRO1387, PRO1387, PRO1380, PRO1414, PRO1317, PRO13140, PRO1322,

PRO1987, PRO1388, PRO1387, PRO1380, PRO1414, PRO1317, PRO13180,

PRO1987, PRO1388, PRO1387, PRO1380, PRO1414, PRO1317, PRO1418, PRO1818,

PRO1987, PRO1888, PRO1184, PRO1881, PRO1274, PRO4322,

CRO1481, PRO2229, PRO788, PRO1184, PRO1327, PRO1488, PRO4322,

PRO1881, PRO5225, PRO7154, or PRO1065 polypeptide are useful for checeting the presence of tumour in a mammal which

controles comparing the level of expression of the above PRO polypeptides

involves comparing the level of expression of the above PRO polypeptides

control eats sample of cells taxen from the mammal, and a control sample

control calls of the same cell type, where a higher level of expression of the indicative of the presence of tumour in the mammal call tumour is lung

the indicative of the presence of tumour in the temmular is lung

cumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour, rectal tumour, rectal tumour, rectal tumour or liver tumour, rectal tumour, rectal tumour, rectal tumour or liver tumour, rectal tumour or liver and propression of the prosence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated PRO polypeptide useful for tissue typing, gene therapy, molecular weight markers in protein electrophoresis, for treating arthritis, tumor.
                                                                                                                                                                                     Human, secreted and transmembrane protein, PRO, gene, ss, cytostatic, vulnerary, antiarthritic; pericyte cell proliferation, chondrocyte cell differentiation, chondrocyte cell differentiation, tumour necrosis factor alpha release (TNR)-alpha release; dermal fibroblast cell proliferation, dermal fibroblast cell differentiation inhibitor; tumour, lung tumour; colon tumour, breast tumour; prostate tumour; rectal tumour; liver tumour; tissue typing; chromosome mapping; gene mapping;
                                                                                                                                          Novel human secreted and transmembrane protein PRO10111 cDNA,
ADB78012 standard; cDNA; 1837 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 2; Fig 39; 308pp; English.

typing, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO127 or PRO460 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This sequence encodes a human secreted and transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMR)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PJ;

antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in issue typing. This sequence represents a human PRO polymucleotide of the invention.

detecting tumours (e.g. lung tumour, colon tumour, breast tumour, corstate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF) -alpha from human blood, for stimulating the proliferation of differentiation of conditions of conditions in periotyte cells, for stimulating the proliferation of or gene expression in periotyte cells or for stimulating the proliferation of or gene cormal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating anticonsome and gene mapping, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful cernology, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful careparts and in generating tromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, are useful for preparing a medicament for treating a condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as periotyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for procein electrophoresis, and in tissue typing. This sequence represents a human PRO polymocial of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
